

GRANAB Subfloor system 3000N

ADJUSTABLE HEIGHT 30–180mm, EXCL. FLOOR COVERING

System information

S-3000N is an inorganic system consisting of galvanised floor profiles, support blocks with dampening elements for sound insulation, level adjustment screws and concrete anchors/screws.

The girders are delivered pre-cut to the correct lengths for each project, labelled with the room name and length measurements. Support blocks and dampening elements are pre-assembled at our factory.

The girders can also be delivered in full lengths (2600/3800mm) by agreement. S-3000N can be combined with dampening elements ROT, 6m and 12mm.

Distances and floor finishes

The standard distance between the attachments in the girders to the slab is c/c 600mm

The standard distance between the girders is c/c 400mm to the second girder, then c/c 600mm, but this depends on the floor finish to be used. For example, for terrazzo, tiles and/or floating screed the distance between girders is c/c 300mm.

Accessories

S-3000N can be combined with cellular polypropylene sheets, which are placed on the girder's wings.
